

Water level in Lake Skorradalsvatn 2023

The water level of Lake Skorradalsvatn dropped below ON Power's limits at the end of 2022 and beginning of 2023 because of a long-lasting cold period and minimal inflow to the lake. The water level dropped below the limits again in late summer due to droughty conditions in July. The water level exceeded ON Power's limits in February of 2023 due to an intense snow melting event and again in May following a rainy period. The Icelandic Meteorological Office has prepared an inflow model for Lake Skorradalsvatn, which shows the inflow into the lake three days in advance.
