# Volume of geothermal water from the Nesjavellir Geothermal Power Plant by release route

Geothermal water (thous.m<sup>3</sup>/year) from Nesjavellir Geothermal Power Plant 2013-2023 by release route. Volumes are rounded to thousands of tonnes.

# Volume of geothermal water from the Hellisheiði Geothermal Power Plant by release route 2007 – 2023

Until September 2011, the largest part of geothermal water was reinjected through wells in Gráuhnúkar. Geothermal water from the plant increased when the Sleggjan plant was launched in autumn 2011, but the reinjection field at Húsþúli was then put into full operation. Since then, the geothermal water from the plant has increased. Reinjection in discontinued production wells within the production field started in 2014 and in boreholes in Threngsli in 2016. 2022 saw the start of project that involves mixing geothermal water with heated groundwater for district heating for a better utilization of the geothermal resource, reducing the extraction of groundwater at Engidalur and the reinjection utility.

Volumes are rounded to thousands of tons

# **Geothermal fluids discharged via overflows at the Hellisheiði and Nesjavellir Geothermal Power Plants in 2023**

The reinjection utility is vulnerable to any operational changes and approximately 1.4% of produced geothermal water at Hellisheiði Power Plant was released via overflow. Licensors have been kept informed on the situation, on actions available at any given time and of the ongoing projects to increase the reception of the reinjection utility.

# Chemical composition of geothermal water and heated groundwater for space heating from geothermal power plants in the Hengill area

Typical concentrations ( $\mu\text{g/L}$ ) of several trace elements in geothermal water (separated water) and heated groundwater (for space heating) from the Hellisheiði and Nesjavellir geothermal power plants and their maximum permissible concentrations ( $\mu\text{g/L}$ ) for potable water. Values exceeding the maximum are indicated in bold.

# Chemical composition of groundwater in wells around the Hellisheiði Power Plant in 2023

The impact of the Hellisheiði Power Plant on groundwater is closely monitored in surveillance wells at and around the plant. Samples are collected to analyse overall chemical content and trace elements, in addition to measuring their temperature, conductivity and acidity.

| Well                |       | HK-07         | KH-50    | KH-12                                    | KH-44    | KH-06            | KH-52     | HK-29      |
